

Dragon Fruit

Hylocereus Undatus. The dragon fruit is an oval shaped berry, about 6-12cm in diameter and red or yellow in color. Most species have a fleshy epidermis with triangular bracts of waxy appearance. The pulp of the fruit is translucent, containing many black seeds inside.

They must be whole and without wounds, have a fresh aspect and firm consistency, the peduncle must measure 15 to 20 mm in length, clean (without thorns), free of foreign matter visible mainly in the apical hole, free of strange odors and flavors.

Growing season: August - November: High
December - July: Low

Uses: High protein and fiber content
Fresh and natural consumption
Sweet and refreshing taste
Used for healthy smoothies and snacks
Cocktails.
